

Release: 1.5.4

Release Date:

Gold Master Version 1.5.4 has been officially released on July 23rd, 2018. This release includes some new features, bug fixes, and performance improvements.

The major Features which are included in this version are as follows:

- Default Template Choice on Create
- How to configure iframe in an Entity Type

Also, this release covers some of the major bug fixes that are mentioned below:

- Fixed: We have fixed the issue with group constraint on fields in Entities. Now, it doesn't give user an error when saving an Entity Item when group constraint is applied.
- Fixed: Entity fields that are hidden in Case Portal Configuration are displayed in Case Type when creating a case from Case Portal has now been fixed.
- Fixed: In Dynamic template, fields with same order have given error on update or displayed only one field. This issue has been fixed and now fields with same order are displayed one after the other.
- Fixed: In Standards, when user clicked on View Blockchain Log for a Book and tried to view Download PDF Snapshot it was displaying blank. Now this issue has been fixed and user can view the PDF snapshot when they download it.

1.7.1 - Default Template Choice on Create

An Entity Type can have one or more templates applied. If the Entity Type do not have any template being configured as a default template use when creating a new entity (Default for New option), the system would give user an option to select the dynamic template type that they want to use during creating an Entity item.

For example, the Leasing Contract Entity Type in the below example has multiple templates created. When the user clicks on to create a new item from Entities Origination Center or from Entity List page it gives the list of templates that are configured for the Leasing contract and user can select the appropriate dynamic template from the list to create a new entity item
